ABSTRACT

Millennium Rules Migrator:

The client configured custom field validations in the form conversations are known as Rules in Cerner Millennium solutions.

Currently these validations are created in an application called PMDbConv. The rules are created using VB script. This technology is quite old and newer applications like RevenueCycle uses a newer and user friendly way to create the Rules.

Since most of the clients will be migrating to the upgraded millennium solutions and will be adopting RevenueCycle soon, we need an automated way to migrate the existing client created data and use it RevenueCycle without any additional efforts from the clients

The new type of rules are created in XML format with predefined elements. The application should be able to convert the Rules written in VB script to XML format and function the same way without any differences.
