Influence of Covid-19 Pandemic on Patients with non-communicable diseases in Select tertiary care hospitals in Mangalore: A Cross sectional study

It was observed that a higher proportion of the study participants were employed and belonged to the age group of > 50 years.

- The most common NCD amongst the study population was Cancer.
- The biggest medical problem faced by the study population was the inability to access their health care provider during the COVID-19 pandemic.
- The Physical, Psychological, Social and Environmental quality of life of the study participants was above average.

Keywords: Pandemic, Covid-19, non communicable, influence
